

# Insights from the Superstore Dataset

- This dataset captures three months of sales from a supermarket chain operating in three branches across major cities, offering insights into retail trends and customer behaviour.
- The Invoice ID column was excluded from the analysis, as it serves only as a unique transaction identifier and does not contribute to any meaningful insights or analytical value.
- The Branch column was removed from the dataset, as each Branch corresponds to only one City. Since it provides redundant information, it does not add value to the analysis
